

React: child to parent

React – what is the color?

The following exercise contains the following subjects:

- communicated from a child to a parent

Instructions

We have a parent component, that renders three CustomButton components which are simple buttons. Each time the user presses one of the buttons, the parent should show which color in the button was selected.

[Video example](#)

We have an array of colors:

```
const colors = ["blue", "red", "yellow"];
```

1. Create a CustomButton component.
2. Loop over the colors array and in every iteration render a CustomButton component that will take the color as a prop.
3. When we click on a specific button we need to send that specific color back to the parent which will save that color to state and display it to the DOM.
